

BioWorks®
How You Grow Matters™

Compatibility Chart*

RootShield® is a biological fungicide for the control of many root diseases. The active ingredient is a living microbe (*Trichoderma harzianum* strain T-22), which, after application, grows onto plant roots and foliage.

Recommendations: RootShield is compatible with the following compounds and can be applied before or after the application of the compound. Even though the a.i. is a fungus, extensive research has shown that RootShield WP can be tank-mixed with many fungicides (see compatibility table on back). For incompatible fungicides, BioWorks recommends that RootShield be applied 10 to 14 days before or after chemical fungicide application.
